

Farm Master Plan (Full Integrated Proposal)

Mission Statement

This farm is designed as a sustainable, debt-free agricultural system integrating food production, workforce training, and community outreach. The system operates using a circular zone-based model to maximize efficiency, safety, and long-term scalability.

Zone System Overview

The farm is organized into three primary zones: Zone 2 (Crops & Public), Zone 1A (Core Operations & Living), and Zone 1 (Livestock Core). These zones function as layered rings, ensuring controlled movement, biosecurity, and efficient workflow.

Zone 2 – Crops & Public Access

Purpose: Public interaction, education, and crop production.

Includes entry parking, farm stand, training center, teaching beds, and main production fields.

Inner crop ring supports high-touch crops (greens, beans, squash). Outer crop ring supports bulk crops (potatoes, corn).

Public access is restricted to this zone only.

Zone 1A – Core Operations & Living Hub

Purpose: Central control, housing, and operational support.

Includes: Farm manager residence (4 bed / 3 bath modular with decks, hatchery, and pool), bunkhouse (capacity 2–12), equipment hub, LGD control area, and two septic systems.

Utilities include high-capacity well system, 300–400 amp electrical system, and generator readiness.

Zone 1 – Livestock Core

Purpose: Animal production and nutrient cycling.

Central pond anchors ducks and geese. Surrounding areas include poultry, goats, pigs, and cattle in managed zones.

Compost area is located at the outer edge of the livestock zone.

No public access is permitted due to safety and LGD presence.

Infrastructure Systems

Water: Well-based system with high-capacity pump and optional irrigation support.

Septic: Two systems (house and bunkhouse), with Zone 2 facilities tied to bunkhouse system.

Electrical: Centralized service with subpanels; solar used for outdoor lighting.

Backup Power: Generator required for critical systems.

Machinery & Fleet

Includes truck, livestock trailer, tractor, and four UTVs assigned by zone for operational efficiency.

Housing & Workforce

Bunkhouse supports workforce development pipeline from training programs to active farm roles.

Housing placement supports both privacy and operational efficiency.

Financial Model

The farm operates on a 100% debt-free model through phased development, grants, donations, and limited revenue from the farm stand.

Distribution System

Three-tier model: Tier 1 (schools and farm stand), Tier 2 (residents and outreach), Tier 3 (livestock feed).

Safety & Biosecurity

Controlled access between zones, restricted livestock areas, LGD isolation, and supervision policies ensure safety for all participants.

Phased Development

Phase 1: Initial infrastructure and production. Phase 2: Expansion and farm stand. Phase 3: Full operations. Phase 4: Workforce programs and scaling.

Final Statement

This plan represents a complete, scalable agricultural system designed for long-term sustainability, operational efficiency, and community impact.
